

Instructions

“Arrange the objects according to their similarity”

Similar objects are put close together; dissimilar objects are put further apart. So, the distance between two objects represents their dissimilarity.

For example:

This is a similarity arrangement of objects A, B, and C.

A and B are the most similar

A and C are the most dissimilar

A and B are more similar than B and C

How to select and move objects:

Left mouse click: to select and drag object(s)

Right mouse click on one object: to add object to your selection

Right mouse click and move over objects: to create a circle in which all objects are selected

'Z' key: to move all objects closer together (closer to the midpoint of the circle)

'A' key: to move all objects further apart (further from the midpoint of the circle)
